

Parallels® Plesk Panel Power Pack – This popular add-on to Parallels® Plesk Panel installs all of the most popular software and tools with your initial control panel installation or as an easy upgrade later. It includes options for spam protection, development tools, database tools and the finest collection of web applications available today.

With Parallels Plesk Panel Power Pack you can:

- ✓ **Protect your email users from spam**
SpamAssassin is the most popular and well recognized tool for spam filtration on the market. This tool will help your email users significantly reduce the amount of spam they receive, which leads to higher user satisfaction and increased productivity.
- ✓ **Let Developers have the best Java tools**
Tomcat is the Servlet container that provides the environment for executing Java Servlets. The Tomcat add-on supports deploying and managing Tomcat web applications allowing users to set up hosting with JSP support. This support allows you to deploy a wide range of Java based applications.
- ✓ **Make customers stickier with a Coldfusion environment**
Coldfusion is one of the most popular development environments on the market. When an application uses Coldfusion, the end customer sticks with it longer. Using this add-on module, admins can configure ColdFusion paths and enable/disable ColdFusion support in the setup.
- ✓ **Install hundreds of applications in one click!**
Modern websites are more than just text and images. With the **APS Catalog**, you can browse through hundreds of web applications such as social media, ecommerce, rich email, content management and CRM. Just choose the ones you need and add them to your website with a single click.
- ✓ **Support popular databases**
PostgreSQL or MSSQL add-ons include web-based database administration software (like PhpPgAdmin), giving users remote access to their databases. With one of the world's most advanced relational database management systems, Power Pack enables users to deploy and manage databases right from the user interface with a few clicks.
- ✓ **Be supportive**
Multi-Level HelpDesk is designed to communicate, track, monitor and manage support issues for users at every level of the system. Organize all of your customers' support requests from a single centralized location.

What is the APS Catalog?

The **APS Catalog** is the largest collection of web-enabled applications for servers. Independent software vendors (ISVs) package their applications according to the **APS standard**, an open web standard managed by the non-profit organization APStandard.org.

The APS Standard is a set of specifications that covers provisioning, management and integration of cloud-based services and applications. APS covers the life cycle of applications and was designed from the ground up to address requirements of software-as-a-service (SaaS) and cloud computing paradigms.

The applications in the APS Catalog represent a broad range of commercial and open source software. Parallels control panels link directly to the APS catalog, allowing one-click delivery of many SaaS applications designed to enhance website and server usability.
